SECTION 1 · CRYPTO MONETIZED GAMING

A fully integrated player economy for PROJECT Я

SECTION 1

CRYPTO MONETIZED GAMING

The objective is not merely to attach a token to a game. The objective is to build the game itself as an economy: playing, creating, trading, discovering, providing services, operating infrastructure and contributing to the world can all generate measurable value.

FOUNDING RULE

Every player may participate in the economy, but no player is promised profit. Rewards should come from bounded reward pools, real demand, productive contribution, risk, scarcity, services or creation - not unlimited token issuance for time spent.

1.1 The world is the economy

In the PROJECT Я model, the game world and the economic system are the same system. A player does not leave the game in order to become economic; the economy is present in ordinary play.

1.2 What can be monetized

Economic path	Examples
Playing	Quests, PvP, exploration, resource gathering, achievements and seasonal events.
Creating	Maps, skins, characters, stories, music, quests, mods, AI companions and tools.
Trading	Marketplace sales, auctions, rentals, crafting, upgrades and player-to-player commerce.
Services	Coaching, escorting, guild management, building, transport, repair and specialist labor.

Attention	Streaming, clips, tournaments, community events, media and cultural production.
Discovery	Rare locations, resources, artifacts, bugs, lore, hidden objectives and research.
Governance	Voting, moderation, dispute resolution and community stewardship.
Infrastructure	Hosting worlds, nodes, compute, storage, matchmaking or local AI capacity.
Onboarding	Bringing verified new players who become active participants.
Ownership	Land, ships, structures, businesses, licenses, collectibles and guild assets.

1.3 Three-layer economy

A single token should not carry every economic function. The recommended structure separates scarce ecosystem value, high-frequency game activity and player-owned assets.

Layer	Purpose	Typical uses
Я TOKEN	Scarce transferable ecosystem asset	Settlement, governance, staking, premium ownership, marketplace fees, cross-game value
GAME CREDIT	High-frequency internal currency	Quests, crafting, repair, consumables, routine rewards, fees
PLAYER ASSETS	Objects where much of player wealth is created	Land, items, characters, licenses, businesses, collectibles, crafted goods

1.4 Where player rewards come from

The system should be designed so player rewards are financed by identifiable economic inflows rather than by an uncontrolled mint.

The design to avoid is the simple loop: mint new token -> pay players -> players sell -> price collapses. That model can temporarily create activity while weakening the economy that supports it.

1.5 Bounded reward pools

One method for broad participation is a budgeted ecosystem pool. The percentages below are an example framework, not a fixed tokenomic commitment.

Pool	Illustrative share
------	--------------------

Gameplay	40%
Creators	20%
Marketplace and service providers	15%
Guild and community	10%
Infrastructure and nodes	10%
Discovery and bounties	5%

A bounded pool allows broad earning without promising unlimited emission. Reward weights can change according to demand, season, treasury health and the actual economic needs of the world.

1.6 Contribution ledger

A contribution ledger can record the kinds of value a player creates. It should not be a direct promise that one score point equals one unit of money.

$$\begin{aligned} \text{PLAYER VALUE SCORE} \\ = \\ \text{play contribution} \\ + \text{creation} \\ + \text{marketplace activity} \\ + \text{community contribution} \\ + \text{discovery} \\ + \text{infrastructure} \\ + \text{reputation} \end{aligned}$$

The ledger can determine eligibility, reputation, access, weighting in reward pools, guild privileges, creator status or bounty priority. It becomes a measure of participation and contribution, not a guaranteed investment return.

1.7 ЯBOT as an economic agent

The distinctive PROJECT Я opportunity is to make the player's ЯBOT part of the game economy. The bot can act as a companion and tool while economic authority remains with the player.

Players may train or configure their ЯBOT for specialized in-game roles.

Bots may perform allowed game labor, gather information, assist with discovery, create media or support guild operations.

Bots may trade or execute economic actions only within explicit player permissions and game rules.

Value created by an agent should remain attributable to its player, guild or jointly defined ownership contract.

An agent must not silently expose private keys, local mind data or device-local heart/model state.

1.8 PROJECT Я economic stack

$$\begin{aligned} \text{ЯBOT} &= \text{companion / agent} \\ \text{Я GAME} &= \text{world} \\ \text{Я TOKEN} &= \text{economy / settlement} \\ \text{Я CHAIN} &= \text{ownership / provenance} \\ \text{CHANNEL R} &= \text{media / discovery / culture} \end{aligned}$$

1.9 Design safeguards

Safeguard	Rule
No guaranteed profit	Participation may earn value, but the system must not promise that playing produces a

	financial return.
Bounded emissions	Reward creation must be limited by explicit economic rules and treasury health.
Real sinks	Credits and assets need meaningful uses: crafting, repair, upgrades, travel, land, fees, services and other demand.
Player custody and consent	Wallet actions, trades, staking, transfers and agent actions should be transparent and approval-aware.
Anti-bot / anti-sybil controls	The economy must distinguish genuine contribution from automated farming or duplicate identities.
Market transparency	Fees, reward formulas, inflation schedules, lockups and treasury policies should be inspectable.
Local-first identity	Game participation must not require uploading the player's private local mind or heart.

1.10 Section law

SECTION 1 LAW

Every player can participate in the economy. Economic reward must be tied to value, contribution, scarcity, demand, service, risk or bounded ecosystem budgets. The world may monetize every meaningful role, but the system must not depend on unlimited emissions or promise profit for participation.
